

WEEK ENDING 17TH MAY 2015

KEY POINTS

INFLUENZA AND INFLUENZA-LIKE ILLNESSES (ILI)

Summary: Indicators of influenza activity increased slightly this week, but remain at inter-seasonal levels. Influenza B virus is predominant at present.

- ILI presentations to sentinel general practitioners (GPs) and Emergency Departments (EDs) increased this week.
- Influenza B constituted the majority of influenza viruses subtyped this week; influenza A/H3N2 and, to a lesser extent, influenza A/H1N1, continue to co-circulate.
- Overall non-influenza respiratory virus activity remains low.

GASTROENTERITIS

- Gastroenteritis presentations to sentinel GPs and EDs continue to fluctuate within expected levels.
- Rotavirus and norovirus detections decreased this week.

VARICELLA AND VIRAL RASHES

- Shingles presentations to sentinel GPs remain above baseline level.
- Chickenpox presentations are within expected limits.
- No cases of measles or rubella were confirmed this week.
- Several additional cases of mumps have been confirmed, part of an outbreak in highly vaccinated Aboriginal children in the Kimberley region, with spread to a boarding school in Perth, and most likely to another boarding school near Esperance.

Current and archived issues of Virus Watch http://www.public.health.wa.gov.au/3/487/3/virus_watch.pm

Virus Watch is a weekly electronic publication by the Communicable Disease Control Directorate (CDCD) and key collaborators. It provides a brief summary of General Practice and Hospital Emergency Department sentinel surveillance data on influenza-like illness, gastroenteritis and varicella-zoster disease, together with relevant laboratory information, to alert health care workers in WA to important circulating viruses. General Practice data are collected by members of the Sentinel Practitioners Network of Western Australia - SPN(WA). Emergency Department data are provided by the Emergency Department Information System (EDIS), which incorporates data from the following hospitals: Fiona Stanley Hospital, Royal Perth Hospital, Princess Margaret Hospital, King Edward Memorial Hospital, Bunbury Hospital, Armadale Hospital, Joondalup Health Campus, Swan District Hospital and Rockingham General Hospital. Viral laboratory data are obtained from PathWest laboratories at QEII Medical Centre and Princess Margaret Hospital for Children, as well as via notification data sent by all WA laboratories to CDCD, WA Department of Health. All figures and data were accurate at time of publication, but subject to change.

Influenza and Influenza-like Illnesses

Sentinel and Routine Influenza and Influenza-like-Illness detections

The rate of ILI seen at sentinel GPs increased this week. Of 286 routinely collected specimens, 29 (10%) tested positive for influenza virus; 23 specimens were collected at sentinel GP sites, 6 (26%) of which tested positive for influenza virus.

Sentinel Practitioner Network of WA - GP surveillance Rate of ILI per 1000 consultations, 2011 - 2015

The rate of ILI presentations to SPN(WA) GPs increased this week and remains consistent with the level of presentations observed during inter-seasonal periods in recent years.

The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for respiratory viral presentations.

Viral Respiratory ED Presentations and Admissions

Presentations and admissions to sentinel EDs for viral respiratory illness increased this week.

ED Respiratory Viral Presentations, 2011 - 2015

The number of respiratory viral infection presentations to sentinel EDs is within the range of values seen during this time period in recent years.

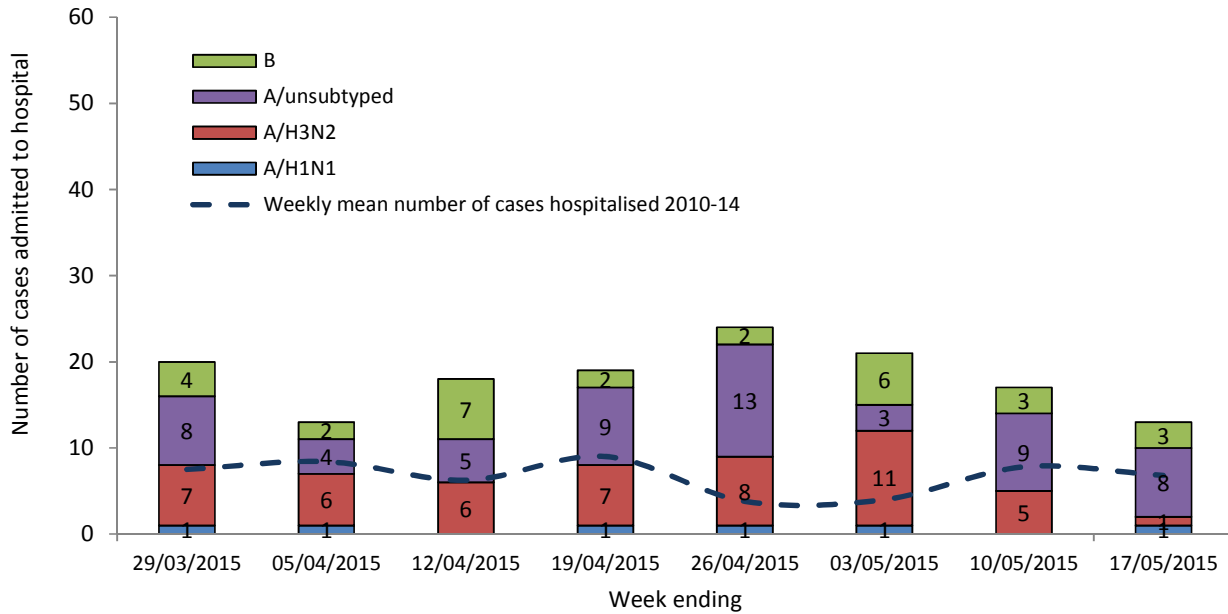

Influenza notifications in Western Australia by week, 2011 to 2015

Influenza notifications received by the Department of Health remain consistent with inter-seasonal levels. There were 53 notifications for influenza this week.

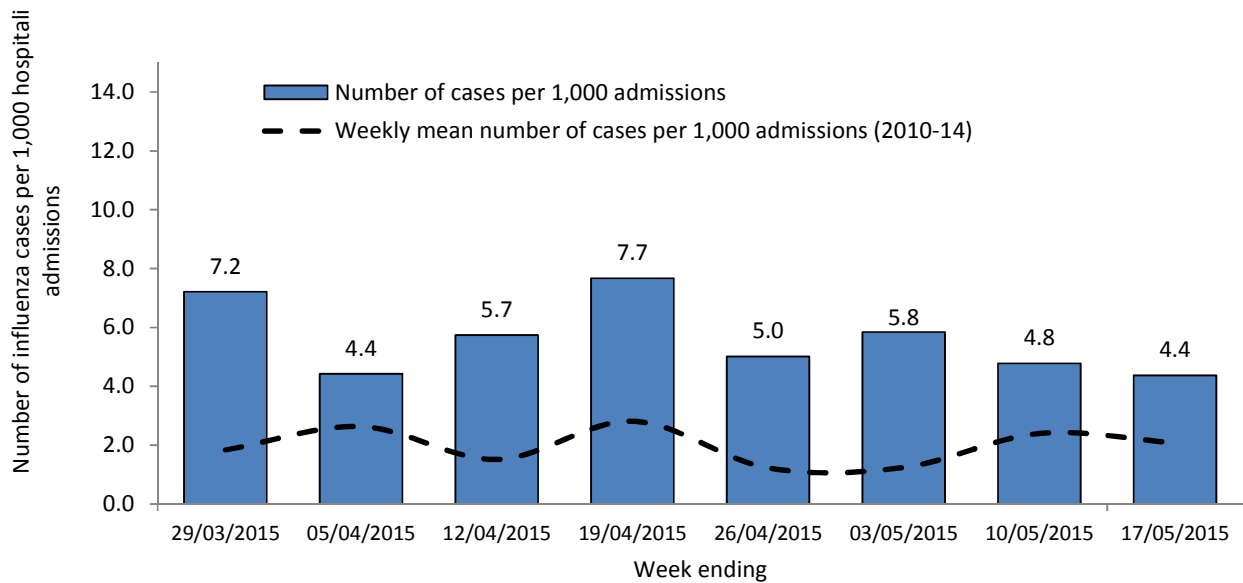

The graph is a summary of all influenza notifications received by the DoH, Western Australia to the end of the current reporting week, for which cases had date of symptom onset or specimen collection between 11/05/2015 and 17/05/2015.

Number of influenza cases hospitalised

Thirteen notified influenza cases were hospitalised in the past week; 8 (61%) with influenza A/untsubtyped, 3 (23%) with influenza B, 1 (8%) with influenza A/H3N2, and 1 (8%) with influenza/H1N1.

Influenza cases per 1000 hospital admissions

The proportion of hospital admissions notified as having laboratory-confirmed influenza remains low and near the average proportion seen during this time period in previous years.

The graph is a summary of influenza notifications received by the DoH who were recorded as having a hospital admission, expressed per 1,000 admissions.

PathWest-QEII-PMH influenza percentage positive 2011- 2015

Among samples tested at PathWest this week, 10.7% were positive for influenza virus, which is slightly higher than the percent positive for this time period in recent years.

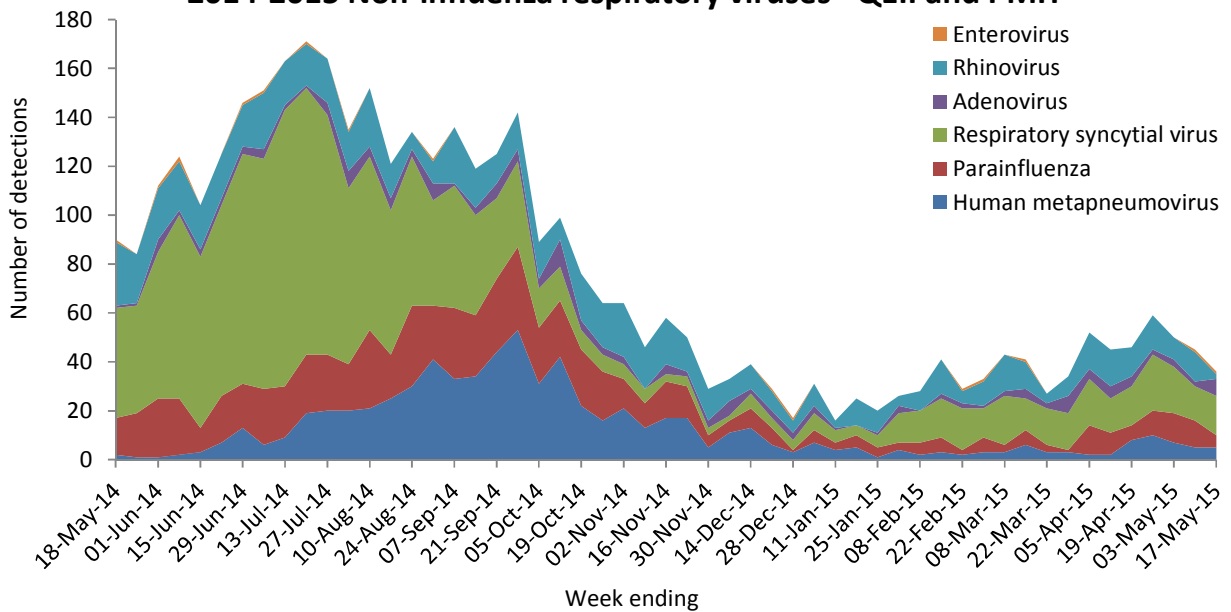

PathWest-QEII-PMH 2014-2015 all influenza subtypes

Thirty three influenza viruses were subtyped by PathWest, QEII and PMH during this reporting week; 13 (39%) were influenza A/H3N2, 2 (6%) were influenza A/H1N1, and 18 (55%) were influenza B.

The graph is a summary of all samples that have been recorded as subtyped at PathWest QEII as of 12.01am Wednesday 13th May 2015. The number subtyped may not always correspond to the number of influenza detections.

2014-2015 Non-influenza respiratory viruses - QEII and PMH

Non-influenza respiratory virus activity remained stable or declined this week, with the exception of adenovirus activity which increased.

Gastroenteritis

Gastroenteritis GP Presentations

Gastroenteritis presentations to SPN(WA) continue to fluctuate between 2-5 presentations per 1,000 consultations. Rotavirus and norovirus detections decreased.

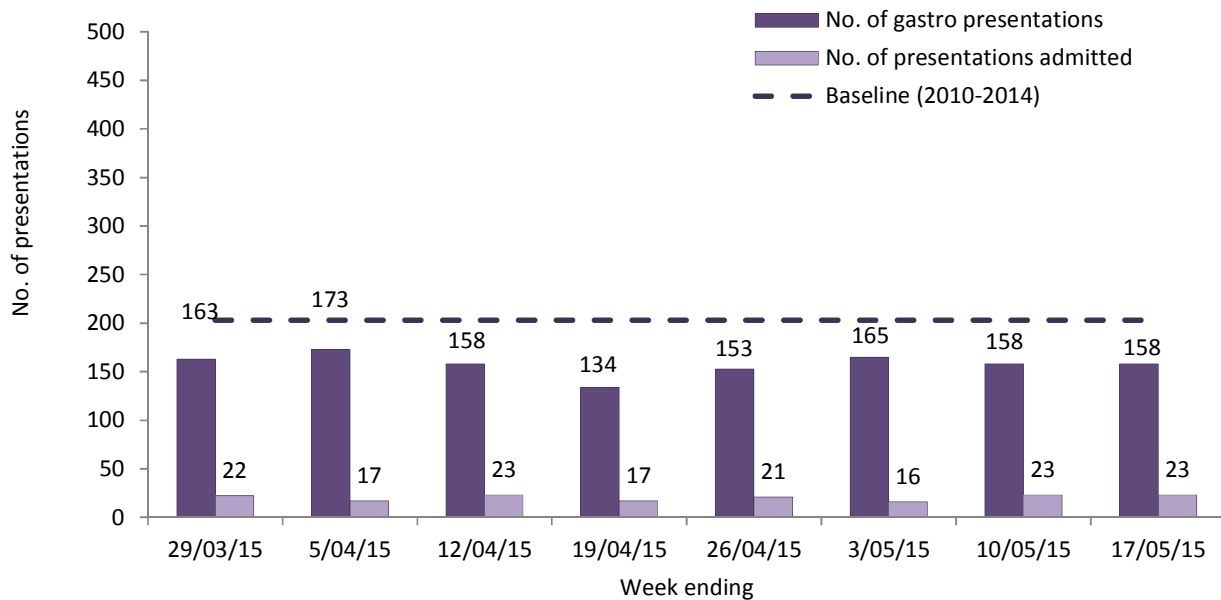

Sentinel Practitioner's Network of WA SPN(WA) - GP surveillance Rate of gastroenteritis per 1000 consultations, 2011 - 2015

The rate of gastroenteritis presentations to sentinel GPs continues to fluctuate within expected levels.

The following is a summary of current Emergency Department Sentinel Surveillance (EDSS) data for gastroenteritis presentations. Baseline levels for gastroenteritis presentations were calculated using the mean of weekly EDIS data from week 1, 2011 to week 52, 2014.

Gastroenteritis ED Presentations

Gastroenteritis presentations and admissions to sentinel EDs remain below baseline level.

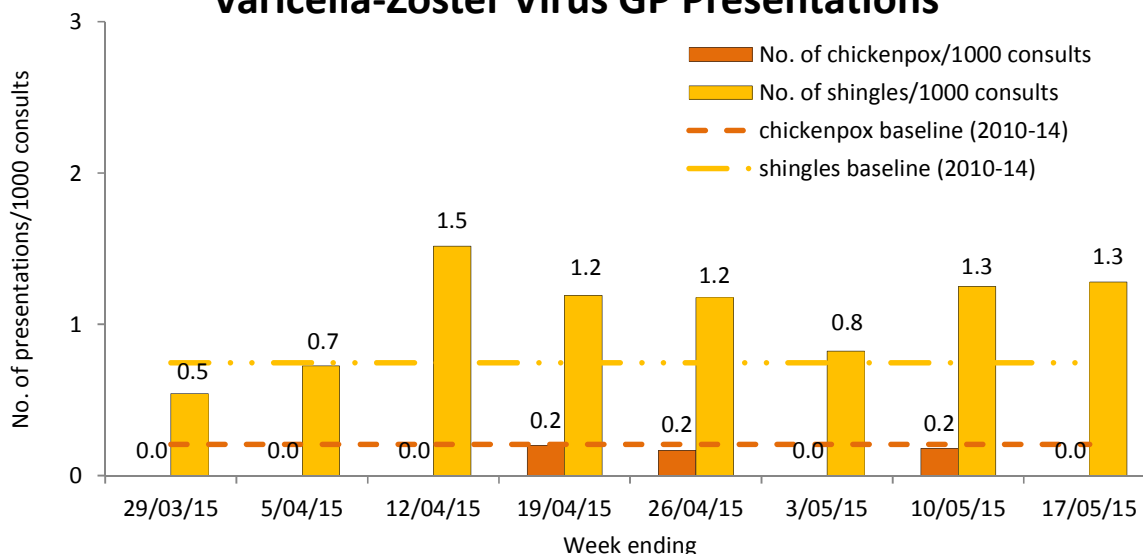

ED Gastroenteritis Presentations 2011 - 2015

The number of gastroenteritis presentations to sentinel EDs is within the expected range of values for this time period.

Viral Rashes

Varicella-Zoster Virus GP Presentations

Shingles presentations to sentinel GPs remain above baseline level. No chickenpox cases were seen at sentinel GPs this week. No measles or rubella cases were reported this week. Several additional cases of mumps have been confirmed, part of an outbreak in highly vaccinated Aboriginal children in the Kimberley region, with spread to a boarding school in Perth, and most likely to another boarding school near Esperance.

Baseline levels for chickenpox and shingles presentations to SPN(WA) GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2010 to week 52, 2014.

The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for varicella-zoster virus presentations. Baseline levels for varicella-zoster virus presentations were calculated using the mean of weekly EDIS data from week 1, 2010 to week 52, 2014.

Varicella-Zoster virus ED Presentations

Shingles and chickenpox presentations to sentinel EDs decreased below baseline levels this week.
